

TED Talk: AI is dangerous, but not for the reasons you think by Sasha Luccioni

https://www.ted.com/talks/sasha_luccioni_ai_is_dangerous_but_not_for_the_reasons_you_think

The TED Talk contains several forms of media bias. Language bias is shown through phrases such as “focusing on AI's future existential risks is a distraction,” which encourages the audience to prioritize present AI issues over future concerns. Emotional bias is created by using examples of false identifications caused by biased facial recognition and artists whose work was used without consent, making the audience feel concerned about AI's current impacts.

Visual bias is evident when the speaker displays AI-generated images that misrepresent women named “Sasha” and images showing scientists and CEOs as mostly white men. These visuals reinforce the argument that AI systems can produce biased and unfair results. The perspectives of this bias are limited because the report only presents the speaker's viewpoint, supported by researchers, artists, and victims of AI bias. It does not include perspectives from the developers or engineers of artificial intelligence, who can show the positive sides of AI.

Although the report emphasizes one perspective, it remains credible because it supports its claims with research, real-world examples, and acknowledges the things people don't know about A.I. in the future
